

# CG-Lock

Funny how a simple idea can sometimes make a big difference. Take the full racing harness, for example. It holds you tightly in your seat and provides major advantages. You don't need to "hang on" when driving hard... you can keep your feet light on the pedals and your hands light on the wheel for better driving control, faster reactions, and less fatigue. You are "one with the vehicle" ...you can sense movement better, react sooner, and "feel" your way through the tricky spots more easily, and your safety is increased. Unfortunately, most of us drive and play in vehicles with standard three-point automotive seat belts, not racing harnesses. That is where the CG-Lock comes in. This simple device clips onto the tongue of your seat belt (the part you push into the buckle that the webbing passes through). Once installed (it takes less than five minutes), you can pull up on the shoulder harness of your seat belt, and the lap belt portion gets tight and stays as tight as you want until you release it! This will provide about 80% of the "holding power" of a full harness to your seat belt and give you the advantages mentioned above. As a bonus you will be able to drive for hours with less fatigue and back pain plus the CG-lock is very effective at holding an infant/child booster seat in place, no sliding around or tipping over! Visit [www.cg-lock.co.uk](http://www.cg-lock.co.uk) for more details, test results and videos. You can buy online too with a discount scheme if you purchase more than one.
